

Particle motion in gases

Cover the answers. Answer each question out loud or on paper, then check. Tick the ones you know.

QUESTION		ANSWER	✓
1	State the effect on the temperature of a gas if the average kinetic energy of its particles increases.	The temperature increases.	☐
2	Describe the cause of gas pressure.	Gas particles colliding with the walls of the container.	☐
3	State the effect on the pressure of a gas of raising its temperature at constant volume.	The pressure increases.	☐
4	Describe the motion of the molecules in a gas.	They are in constant random motion.	☐
5	Explain, using particles, why heating a gas at constant volume increases its pressure.	The particles move faster, so they hit the walls more often and with more force.	☐
