

Infrared radiation and surfaces

A student compares how much infrared radiation different surfaces emit.

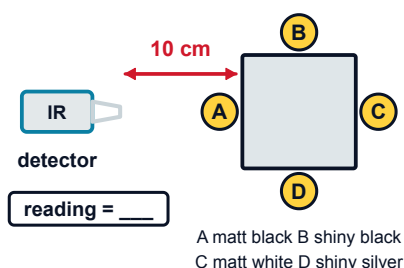

- 1** Fill a Leslie cube with hot water and put the lid on.

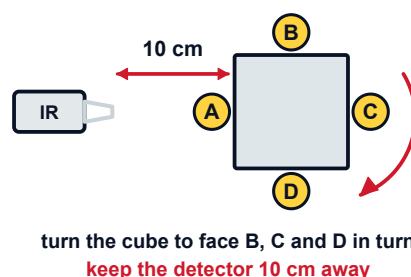

- 2** Leave it for a minute so that every face reaches the same temperature.

- 3** Hold an infrared detector 10 cm from one face and record the reading.

- 4** Repeat for each of the other faces, keeping the detector the same distance away.

- 5** Compare the readings: the highest reading shows the best emitter.
