

Acceleration and force

A student investigates how the force on a trolley affects its acceleration.

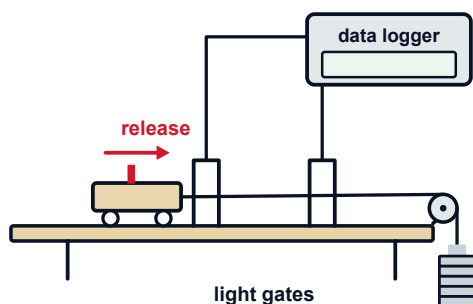

- 1** Attach a string to a trolley and pass it over a pulley at the end of the bench.

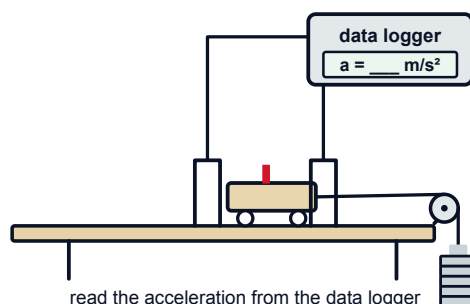

- 2** Hang a stack of slotted masses on the end of the string and hold the trolley still.

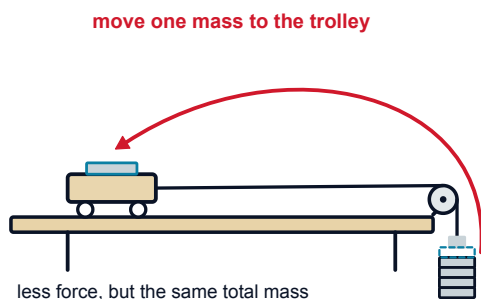

- 3** Release the trolley so that it passes through two light gates.

- 4** Record the acceleration calculated by the data logger.

- 5** Move one slotted mass from the stack to the trolley to reduce the force, then repeat.

- 6** Plot a graph of acceleration against force.
