Black body radiation

Waves
Paper 2 · Separate Physics only
10 questions

Cover the answers. Answer each question out loud or on paper, then check. Tick the ones you know. Learn the 3 starred (★) questions first.

	QUESTION	ANSWER	✓
1	**Name the type of radiation that all objects emit.**	Infrared radiation	☐
2	**Describe how the infrared radiation emitted by an object depends on its temperature.**	The hotter the object, the more it emits.	☐
3 ★	**What is a perfect black body?**	An object that absorbs all the radiation that falls on it.	☐
4	**State the link between how well an object absorbs radiation and how well it emits it.**	A good absorber is also a good emitter.	☐
5 ★	**Describe how the radiation emitted by an object changes as its temperature increases.**	The intensity increases and the peak moves to a shorter wavelength.	☐
6	**An object is at a constant temperature. Compare the radiation it emits and absorbs.**	It absorbs and emits radiation at the same rate.	☐
7 ★	**In terms of radiation, when does the temperature of an object increase?**	When it absorbs radiation faster than it emits it.	☐
8	**State what all objects do, whatever their temperature.**	They emit and absorb infrared radiation.	☐
9	**In terms of radiation, when does the temperature of an object decrease?**	When it emits radiation faster than it absorbs it.	☐
10	**Give three factors that the temperature of the Earth depends on.**	How fast it absorbs radiation How fast it emits radiation How much radiation it reflects into space	☐
