

Refraction of light

A student investigates the refraction of light by a glass block.

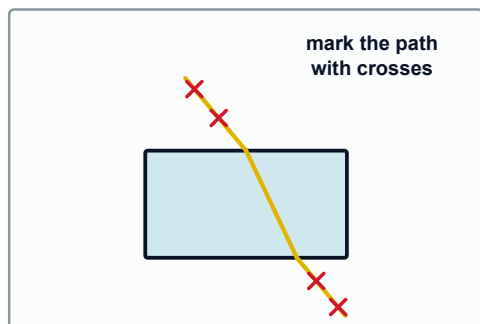

- 1** Place a glass block on a sheet of paper and draw around it.

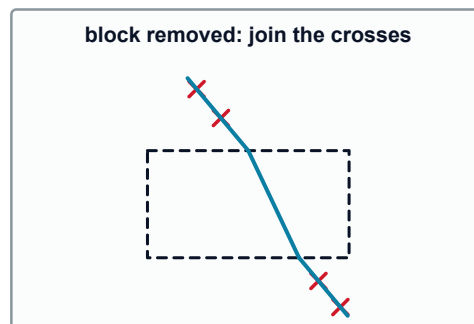

- 2** Shine a narrow ray of light from a ray box at the side of the block.

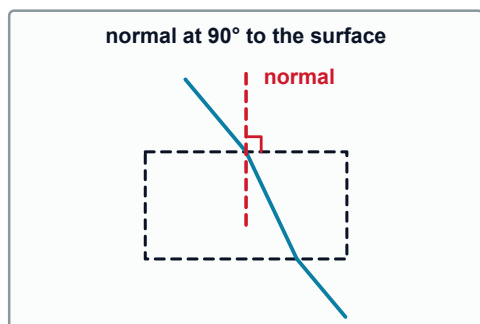

- 3** Mark the path of the ray going in and the ray coming out with crosses.

- 4** Remove the block and join the crosses to show the path of the ray through the glass.

- 5** Draw the normal at the point where the ray enters the block.

- 6** Measure the angle of incidence and the angle of refraction with a protractor.
