Refraction of light

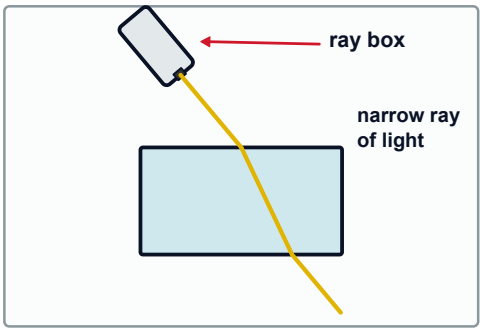

Waves
Paper 2 · Separate Physics only
6 steps

A student investigates the refraction of light by a glass block.

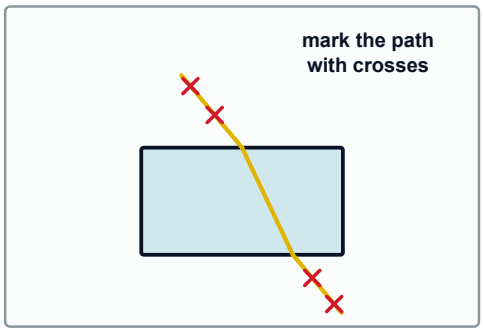

1 Place a glass block on a sheet of paper and draw around it.

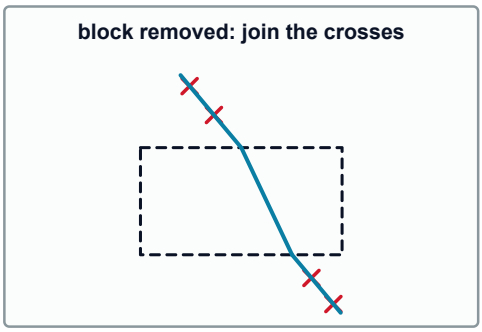

2 Shine a narrow ray of light from a ray box at the side of the block.

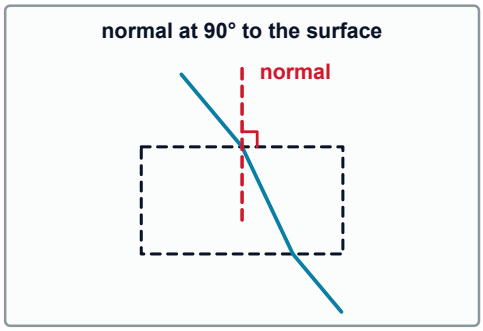

3 Mark the path of the ray going in and the ray coming out with crosses.

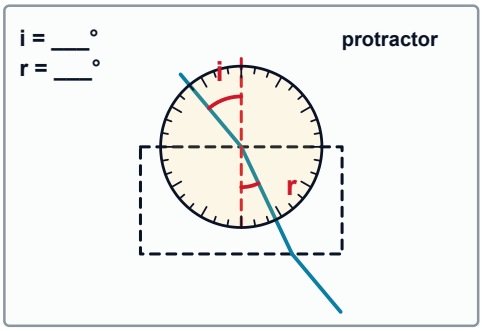

4 Remove the block and join the crosses to show the path of the ray through the glass.

5 Draw the normal at the point where the ray enters the block.

6 Measure the angle of incidence and the angle of refraction with a protractor.
